Sustainable Development Goals (SDGs)

WI 1103 Introduction of sustainability principle

Week 5

Sustainable Development Goals (SDGs)

1 Introduction to concept and methods

Achieving Sustainable Development Worldwide through Cooperation Between Countries

An international agreement initiated by Kofi Annan (UN Secretary-General) to implement the Millennium Development Goals (MDGs) from 2000 to 2015 to achieve sustainable development worldwide.

There are eight goals, each focusing on improving specific/extreme conditions.

Sustainable Development Goals (SDGs)

The SDGs are global and national commitments jointly established by 192 member states of the United Nations (UN) to achieve a better and more sustainable life for everyone on the planet.

There are 17 interrelated and mutually reinforcing SDGs to address the various global challenges we face.

The period from 2015 to 2030 was agreed upon as the Decade of Action for the SDGs.

Definition and Positioning of “Sustainable Development”

The most frequently cited definition of Sustainable Development comes from Our Common Future, also known as the Brundtland Report:

"Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs."

Sustainability is the foundation of today's major global framework: the Sustainable Development Goals.

[a]Report of the World Commission on Environment and Development: Our Common Future

Source: https://www.calsense.com/three-pillars-of-sustainability/

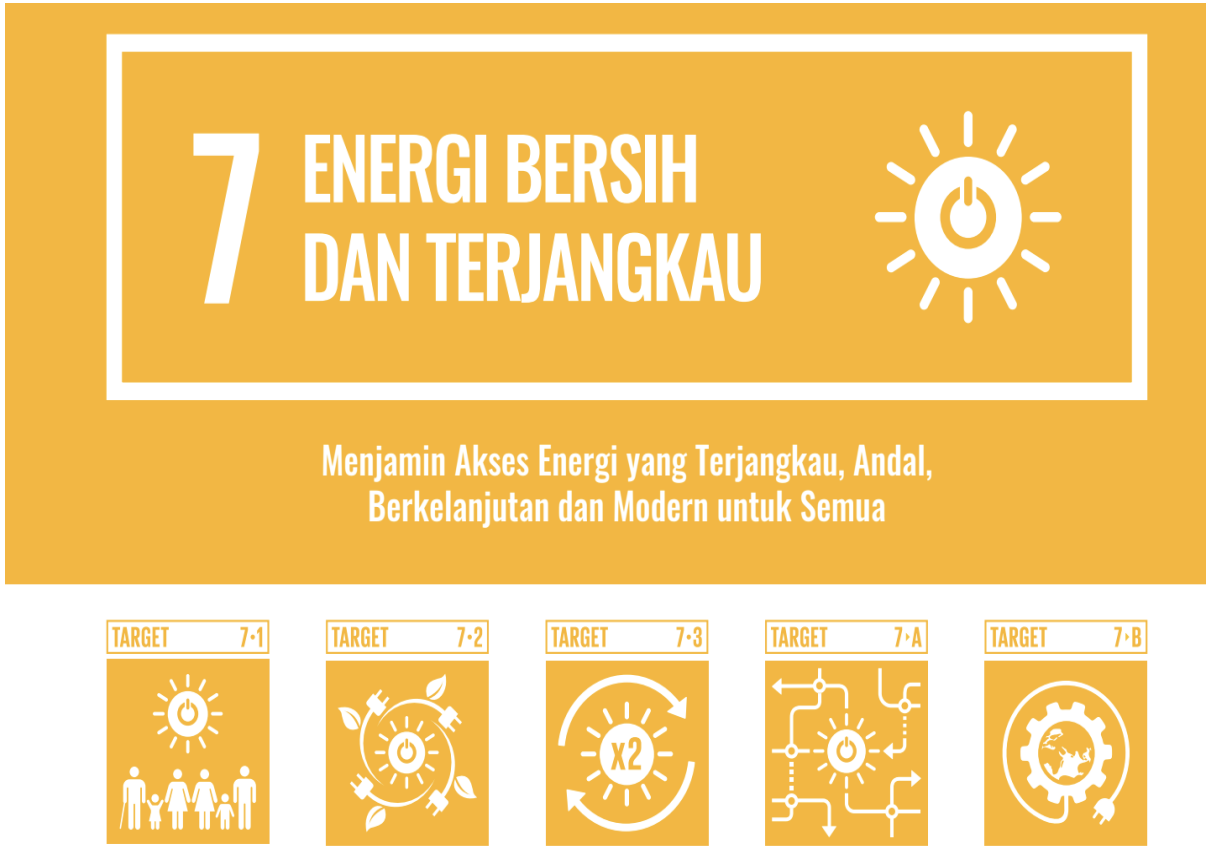

There are three dimensions of Sustainable Development: Economic, Social, and Environmental which must be implemented with the prerequisite of peace and partnership.

To achieve goals, there are targets and indicators.

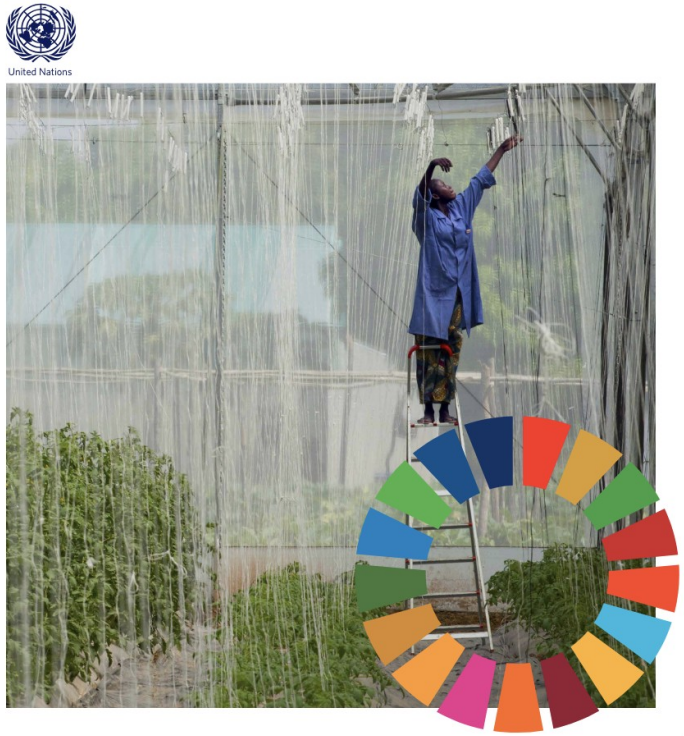

Indicators (289(RI)) → Targets (169) → Goals (17)

The 17 Goals and 169 Targets in the SDGs are designed as an interconnected and inseparable whole. The Goals and Targets apply globally to all countries, but still take into account the differences in conditions, capabilities, and development levels of each country.

There are 231 indicators that apply globally. Indonesia, meanwhile, has 289 indicators tailored to its development targets.

Sustainable Development Goals (SDGs)

2. Adoption in Indonesia

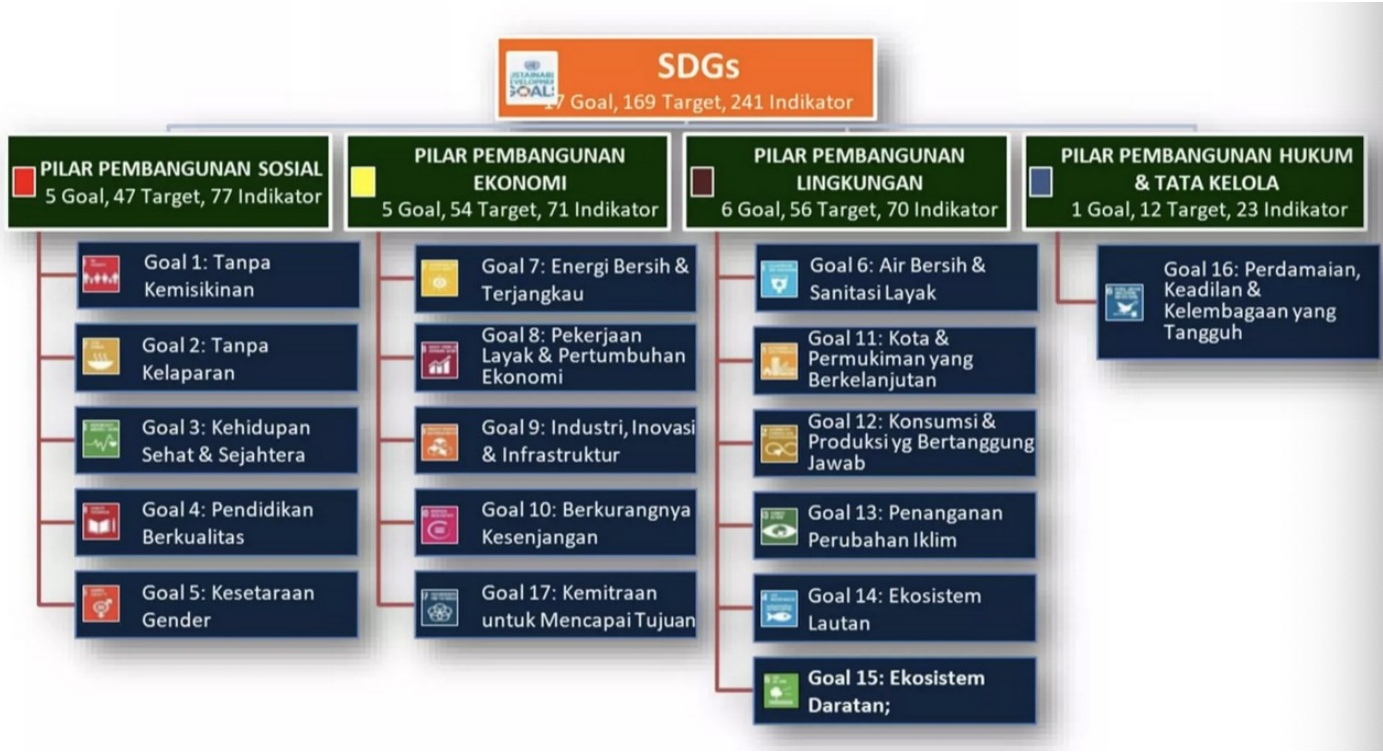

Indonesia's commitment to the SDGs

Indonesia has ratified the SDGs through Presidential Regulation No. 59 of 2017, updated to No. 111/2022.

Indonesia, through Bappenas, matches and incorporates SDG targets/indicators into development in Indonesia.

Indonesia invites partners (private sector, civil society) to participate in achieving these targets.

Indonesia, through Bappenas, has developed a Roadmap for SDG Achievement. [Roadmap link]

TPB Integration in the Regions

SDG achievement is also monitored at the regional level.
This includes the establishment of regional secretariats and data monitoring for achievement.
SDG indicators are also used as indicators of regional development.
The Voluntary Local Review (VLR) is a regional stocktaking report submitted to the UN.

3. Biodiversity Perspective in Indonesia

Achievements of SDGs 14 and 15 in Indonesia

Life on Land

Life below Water

Indonesian Biodiversity Strategy and Action Plan (IBSAP)

Indonesia as a Megadiversity Country ~ Characterized by Coral Reefs (only found in equatorial regions) and rich Biodiversity

The IBSAP 2025-2045 includes the Vision "Living in harmony with nature for the sustainability of all life forms in Indonesia."

To realize this Vision, the Mission is "Managing biodiversity through protection, sustainable use, enrichment of science and technology, and strengthening resources and governance."

IBSAP Functions:
National & regional guidelines for biodiversity management
Indonesia's diplomatic tool in global forums.
Evaluated every 5 years to ensure relevance to current conditions

Rangkuman IBSAP 2025-2045

Biodiversity management plays a crucial role in achieving Indonesia's Sustainable Development Goals (SDGs).

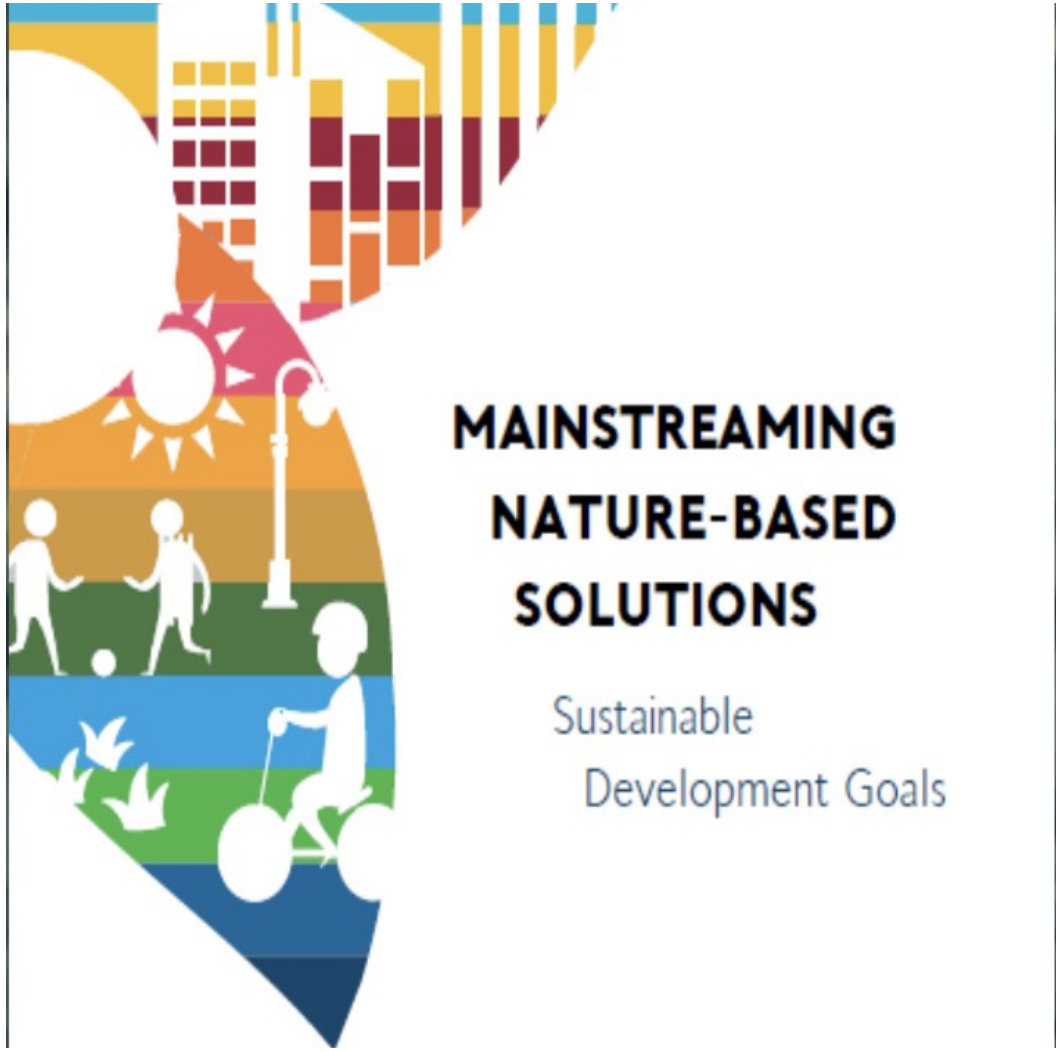

The UNCBD explains that biodiversity is linked to all 17 SDGs, but two goals are closely related: Goal 14 (Marine Ecosystems) and 15 (Terrestrial Ecosystems).

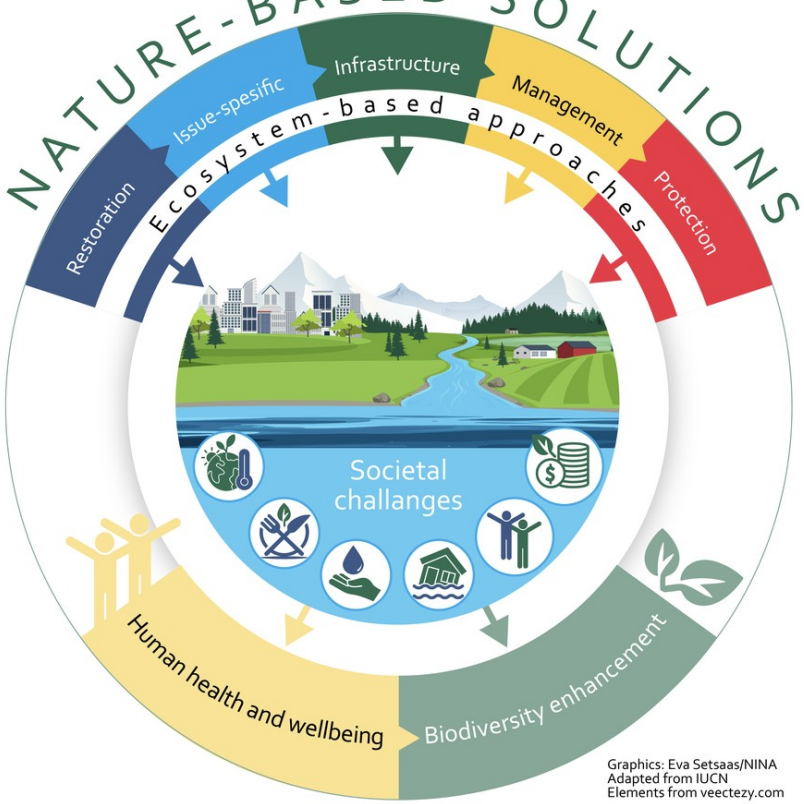

The existence of biodiversity is a vital foundation for life support systems.

Globally, nearly half of the human population depends directly on natural resources for their livelihoods.

Sustainable Development Goals (SDGs)

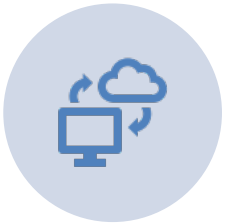

4. The role of science, technology and innovation

The role of ‘Science, Technology dan Innovation (STI)”

SCIENCE

TECHNOLOGY

INNOVATION

STI covers three distinct but closely related areas

Science focuses on the pursuit of knowledge through the systematic study of the structure and behavior of the physical, natural, and social world.
Technology involves the application of knowledge to achieve specific goals.
Innovation is a new way of producing, distributing, or using goods and services based on new technology, new business models, or new ways of economic or social organization.

Sumber: United Nations Industrial Development Organization and United Nations Inter-Agency Task Team on Science, Technology and Innovation for the SDGs, 2022. Science, Technology and Innovation for Achieving the SDGs: Guidelines for Policy Formulation. Vienna.

The Role of Science, Technology and Innovation (STI) in Achieving SDGs

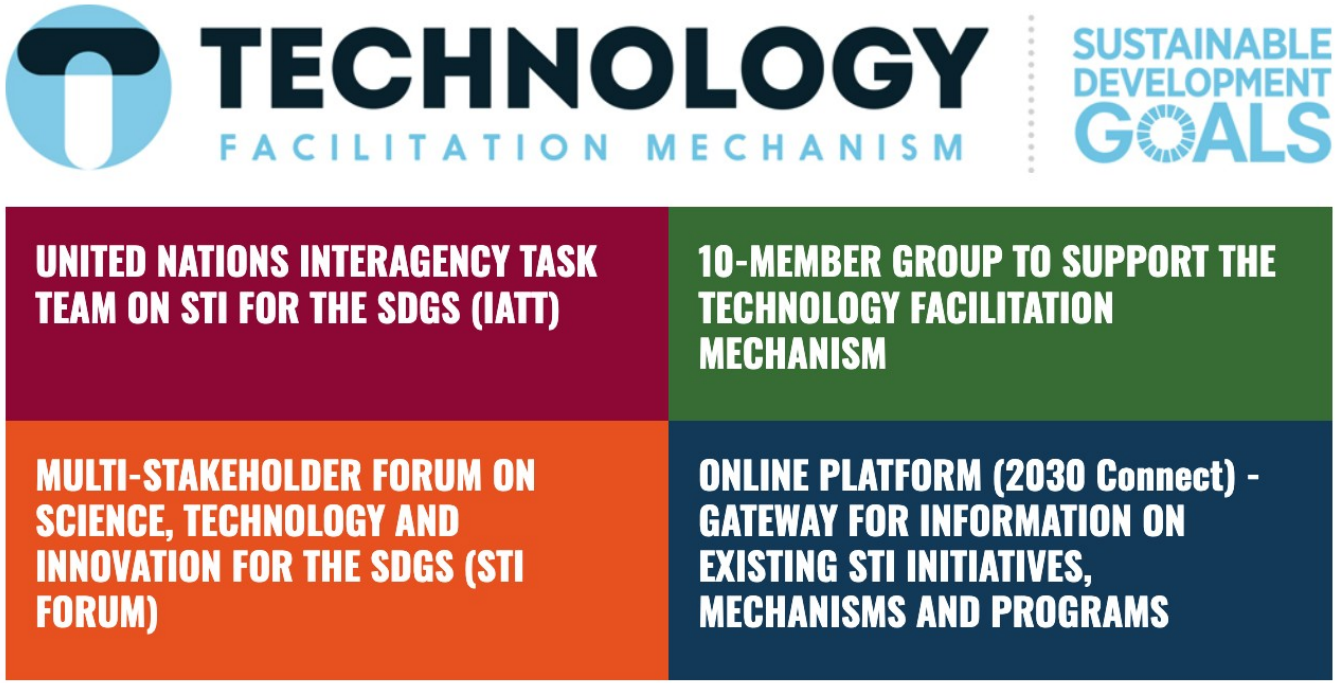

STI is one of the Seven Key Actions for realizing the Sustainable Development Agenda established through the Addis Ababa Action Agenda 2015-2030.

The creation, development, and dissemination of innovations and new technologies, including mutually agreed technology transfer, promote sustainable development.

With STI, every country, including Indonesia, can guide the SDG targets towards universal achievement.

Globally, the role of STI for SDGs is accommodated in the Technology Facilitation Mechanism (TFM)

Of the four TFM components, the STI Forum and 2030 Connect serve as communication and knowledge exchange platforms for STI among countries and stakeholders.

The IATT and the 10-Member Group are the UN's internal communication bodies responsible for monitoring the role of STI in the SDGs.

The role of STI for SDGs is closely related to:

Partnership for the goals

Industry, innovation and infrastructure

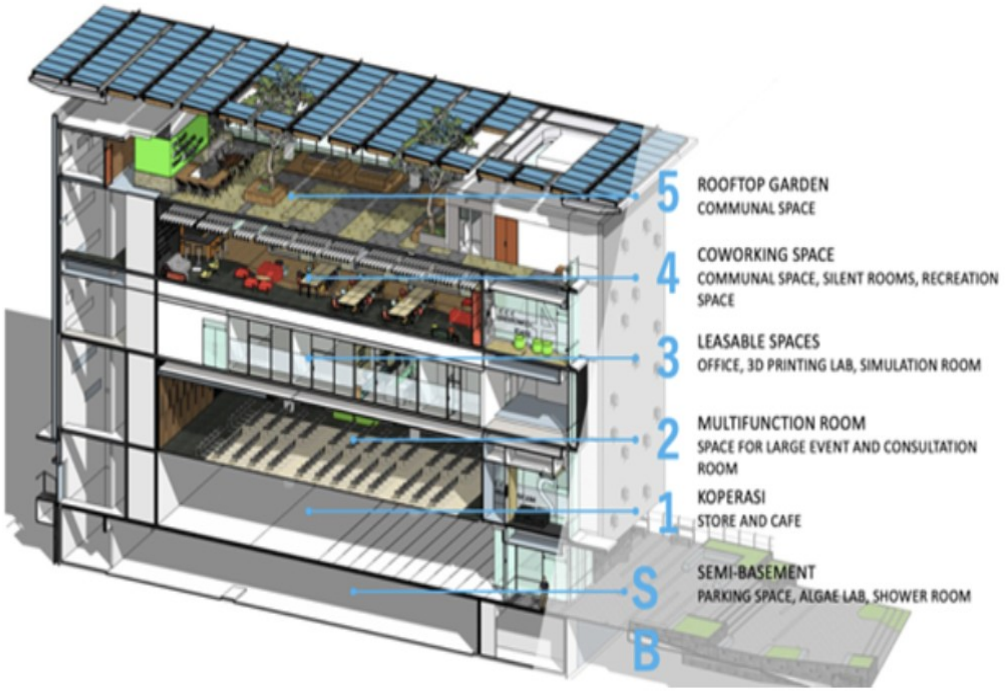

STI Features for TPB Achievement

Related to generating, disseminating, and using "knowledge"

The challenges of each SDG require different STI (knowledge management needs).

Each country will generate and require different STI (place-based priorities).

Sustainable Development Goals (SDGs)

5. Reality Check

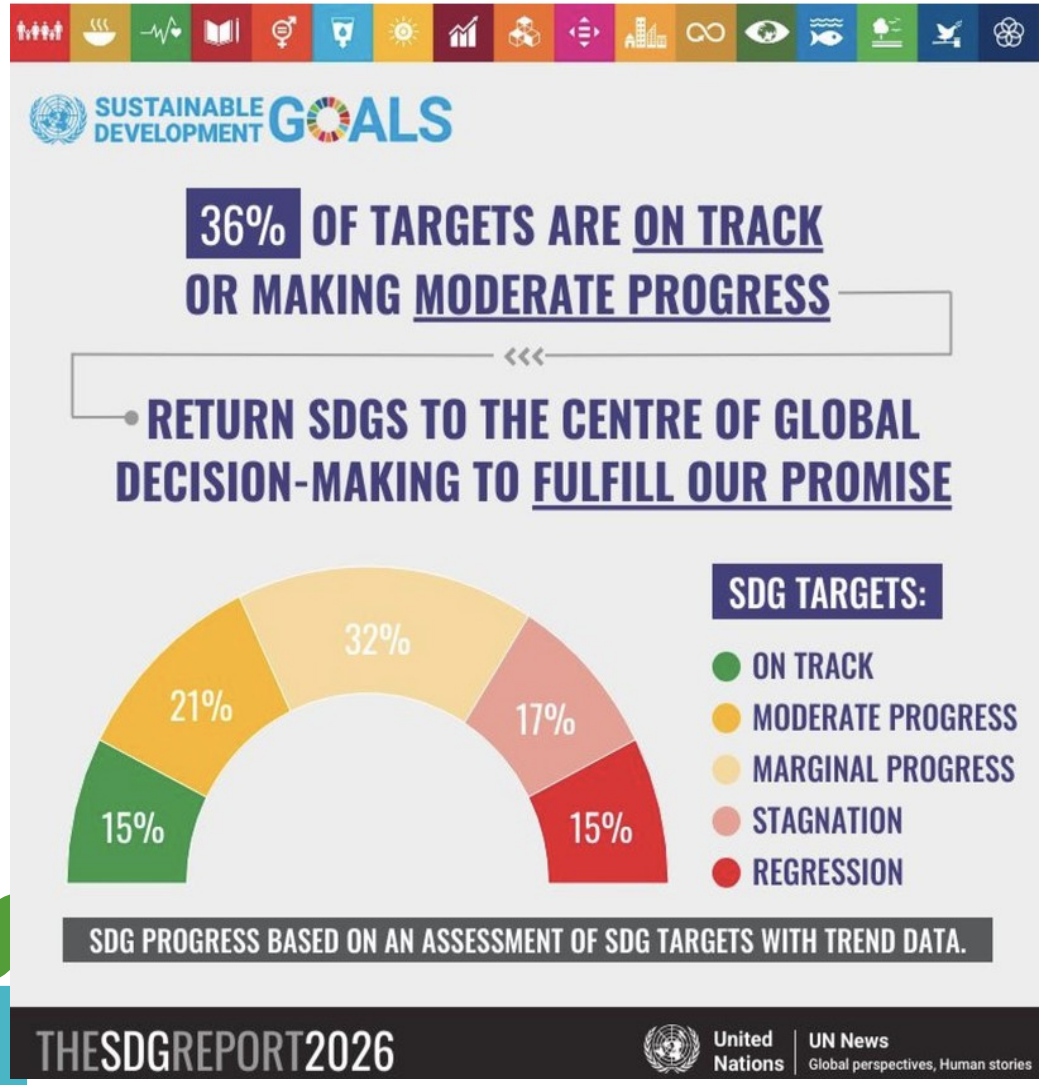

Reality Check: SDG Achievements Midway Through the "Decade of Action" (2023)

Of the 140 targets evaluated:

- 15% of targets are progressing according to the roadmap;
- 48% are not.
- More than 30% of targets are stagnant or declining below the 2015 baseline.
- More databases are being compared across countries.
- More agreed-upon methods.

Reality Check tahun 2026

''Shared Blueprint for Peace'

Achievements:

1 billion people gained access to drinking water
1.2 billion people gained access to safe sanitation
HIV/AIDS infections decreased by 30%
Electricity reached 92% of the world's population
Internet access rose to cover 74% of the population
Social protection reached ½ of the world's population

Still lagging behind:

One in 10 people still lives in extreme poverty
Food insecurity affects 3 billion people
By 2025, Earth's temperature reached 1.43°C above pre-industrial levels
273 million children and youth are out of school
The refugee population increased by more than half compared to the previous decade

Discussion

- Will development efforts through the SDGs yield equitable results in places like the Global South or Indonesia compared to other countries?
- Which SDGs are you most familiar with? And which are the least familiar? Learn and explore and give examples?
- Does the current achievement of SDGs provide optimism for the achievement of the 2030 targets? Explain

Thank You
